

Overview

The SQL Server Performance Review is designed to examine and optimize performance of your SQL Server environment to reduce performance bottlenecks. This can be used as a proactive service to minimize future issues or as a reactive engagement to alleviate existing problems.

Methodology

Data Collection

A Najaxa Software engineer will work with you to do a data collection in your environment. This data will be used to produce a comprehensive report of discovered performance issues.

Expert analysis

Najaxa will analyze your results and help you understand the performance issues that have been discovered. A remediation plan will be provided to guide what needs to be done to improve performance.

Persist and improve

After you or Najaxa have made the suggested improvements to your environment, Najaxa can run another scheduled analysis of your environment to ensure all problems have been resolved.

Available for:

- SQL Server On-Premises/Hosted
- Azure SQL Virtual Machine
- Amazon EC2 (AWS) SQL Server environment
- Azure SQL Managed Instance

Agenda

Welcome Call

This call is intended to go through requirements for analysis and layout the plan for data collection.

Data Collection

Najaxa Software engineer will connect to customer environment and collect data required for analysis.

Engineer Analysis

Najaxa engineer will analyze the results and review the data to give a comprehensive report on the environment.

Your engineer will work with you to develop a prioritized list of recommendations and remediation plan.

Close Out Meeting

Finalize and deliver your results.

Supported Scenarios

- SQL Server Standalone
- SQL Server Failover Cluster Instance
- SQL Server AlwaysOn Availability Group
